AI For Literature Reviews

Taught by Zhen Guo, Sara Morrell, Ayah Aboelela
Class LPSYC4236 Foundations of Psychology
Professor Bakaya
Fall 2025, October 29th

Feel free to ask questions at any point during the presentation!

1

Discussion

- Has anyone ever used ChatGPT or another generative AI?
- What do you think it did well or poorly?
- Were there any aspects of the responses you found odd or misleading?

Northeastern University
NULab for Digital Humanities and Computational Social Science

Workshop Agenda

- Generative AI: Bias, Confabulation/Hallucination, and Ethics
- AI Plagiarism Checkers
- Countering Bias
- Claude and ChatGPT for Literature Reviews
- Other AI-Powered Literature Review Tools: Elicit and Litmaps
- Conclusion

Slides, handouts, and data available at

Feel free to ask questions at any point during the presentation!

Generative AI

Feel free to ask questions at any point during the presentation!

Important questions

- How do human biases impact generative AI model outputs?
- How can we counter the weaknesses of current AI models?
- How can we integrate generative AI with other tools and practices?

Feel free to ask questions at any point during the presentation!

Vocabulary

- [Artificial Intelligence](#) (AI): A technology that "learns" from datasets to solve problems and mimic human intelligence.

- [Large Language Model](#) (LLM): Powerful AI systems designed to understand, generate, and manipulate human language. E.g. GPT4

- [Generative AI](#): It uses AI algorithms that are trained on big datasets in order to create new content, including text, images and audio, in response to a query or prompt. E.g. ChatGPT, Claude, DALLE, Midjourny.

- [Bias in AI](#): The biased outputs due to human biases that existed in original training data or skew the AI algorithm. Could result in potential harms.

N Northeastern University
**NULab for Digital Humanities and**
Computational Social Science

Generative AI: Introduction

AIs like ChatGPT and Claude 3.7 Sonnet (which generate text) and DALL-E and Midjourney (which generate images) work by training on very large datasets of information and then mimicking that training data to produce "new" outputs.

Feel free to ask questions at any point during the presentation!

Generative AI: How it Works

- Generative AIs are fundamentally based on statistics. A text-generation AI like ChatGPT generates words according to patterns learned from the training data.
- Similarly, an image-generation AI learns patterns from existing data and generates images that "looks right" but do not exist in the data. E.g. how AI generates an image of a cat.

Generated by GPT4o
Aug 15th 2025

GENERATIVE AI

EXISTING DATA
studies patterns in

OUTPUT
generates output based on the patterns

Feel free to ask questions at any point during the presentation!

Example prompt: "Explain why someone might be afraid of public speaking, in the style of Sigmund Freud."

Answer: "The fear of public speaking, in many cases, can be traced to unconscious conflicts rooted in childhood experiences. When one stands before an audience, the ego is placed under scrutiny, much like the infant once was under the critical gaze of the parent. The superego, representing internalized societal expectations, may provoke anxiety through an overwhelming demand for perfection and fear of shame. Such a situation may trigger a regression to earlier psychosexual stages—perhaps to the phallic stage—where issues of self-presentation and validation are formed. Thus, what appears to be a modern neurosis is, in fact, the reanimation of primal anxieties from the unconscious mind." -Generated by GPT4

How the Freud Paragraph Was Generated

- A large language model analyzed Freud's existing writings and identified patterns
- These patterns are recreated in the generated text
  - Mimicking his psychoanalytic vocabulary (e.g., ego, superego, regression, unconscious)
  - Using Freudian logic (e.g., adult anxiety linked to childhood experiences)
  - Emulating his style of argumentation, often abstract and speculative.

Confabulation/Hallucination in AI

Feel free to ask questions at any point during the presentation!

Confabulation/Hallucination

- [Confabulation](#) refers to the phenomenon where large language models (LLMs) generate incorrect, nonsensical, or fabricated information, even when presented with seemingly clear and accurate prompts.
- AI confabulation is also referred to as hallucination

Generative AI and "Truth"

- Text-generation AIs aim to produce text that is grammatically correct and linguistically probable.
  - They do not understand "facts," only patterns of word use.
- They can generate truthful text, but also frequently create confabulations/hallucinations.
  - When asked to generate citations, they can generate plausible-looking but fake sources.
  - They may link real but irrelevant sites as sources for made-up facts. They may also invent URLs that do not work and have never worked.

Feel free to ask questions at any point during the presentation!

<u>News</u>: Lawyer Cited AI Fake Cases (1/2)

- In 2023, "Colombia-based Avianca Airlines sought to dismiss a federal court case in which a man, Roberto Mata, alleged he was "struck by a metal serving cart" onboard a 2019 flight and suffered personal injuries."

Lawyer Used ChatGPT In Court—And Cited Fake Cases. A Judge Is Considering Sanctions

By <u>Molly Bohannon</u>, Former Staff. Molly Bohannon has been a Forbes news reporter since 2023.

Published Jun 08, 2023, 02:06pm EDT, Updated Jun 08, 2023, 03:42pm EDT

Feel free to ask questions at any point during the presentation!

News: Lawyer Cited AI Fake Cases (2/2)

- "When filing a response, Mata's lawyers cited at least six other cases to show precedent, including Varghese v. China Southern Airlines and Shaboon v. Egypt Air—but the court found that the cases didn't exist and had "bogus judicial decisions with bogus quotes and bogus internal citations," leading a federal judge to consider sanctions."

- "A member of Mata's law team then revealed he had used ChatGPT to conduct legal research for the court filing that referenced the cases and that the artificial intelligence tool assured him the cases were real." (Bohannon, 203)

Lawyer Used ChatGPT In Court—And Cited Fake Cases. A Judge Is Considering Sanctions

Hallucination: Example citation prompt (1/2)

Prompt: "Generate a list of citations for literature of social psychology on role model."

1. Bandura, A. (1986). Social foundations of thought and action: A social cognitive theory. Prentice-Hall.

Correct source

2. Adjei-Ohene, K. (2023). The influence of media representation on self-efficacy and social roles in Black adolescents: An integrative review. Unpublished manuscript.

Real source, but not peer reviewed.

Northeastern University
NULab for Digital Humanities and Computational Social Science

Hallucination: Example citation prompt (2/2)

Prompt: "Generate a list of citations for literature of social psychology on role model."

3. Zhang, Y., & colleagues. (2025). Effects of social comparison on variety-seeking behavior: The roles of lack of perceived control and self-reflection. Frontiers in Psychology, 16, 1534275.

Wrong authors.

Accurate APA style citation:
Bandura, A., & National Inst of Mental Health. (1986). *Social foundations of thought and action: A social cognitive theory.* Prentice-Hall, Inc.

Citation Style

Feel free to ask questions at any point during the presentation!

Hallucination: Generative AI summary of literature

- AI may inaccurately attribute concepts to individuals or omit co-contributors and earlier influences.
- It may lack citations or invent fake references.
- It may provide a surface level summary that is over simplified and misleading.

Ethics in AI

Feel free to ask questions at any point during the presentation!

Ethics: Generative AI "Originality"

- Some argue that all AI-generated output constitutes plagiarism and copyright infringement, since it is remixing training data that was scraped from the internet without permission from the original creators.
- Many AI companies are [facing lawsuits](#) from people whose content was used as training data without their consent.
- Some publication venues, like the *Science* journals, have made it an [official policy](#) that AI does not meet the standard for authorship and require authors to disclose use of AI.

Ethics: Generative AI Training

- AI training data is sometimes supplemented by labels (annotations) added by people (Amironesei and Díaz, 2024). These labels can worsen bias in training datasets.

- People from middle and low income countries often labor in poor working conditions to annotate data for clients in high income countries. Fieldwork by Muldoon et al (2023) revealed that workers faced traumatizing content, in addition to experiencing discrimination in the workplace and receiving low wages.

- Public awareness can help pressure companies to adopt good practices. For more information on fair labor in AI, see the report [AI for Fair Work: From principles to practices](#) by *[Fairwork](#)*

Feel free to ask questions at any point during the presentation!

Ethics: Environment

- Training and using AI requires processing very large amounts of data, which is done in data centers
- These data centers can have a negative impact on the environment and communities
- Given their intensive energy and water demands, data centers can [worsen local water scarcity](#) and [increase electricity prices](#)
- To explore how the energy use of AI compares to other digital tasks, check out [Jon Ippolito's "What Uses More" app](#)

Bias in AI

What is AI bias?

- The biased outputs due to human biases that exist in the original training data or skew the AI algorithm.
  - Could result in potential harms.
- For example, when AI was used to summarize medical notes, "Google's AI tool Gemma described men's health issues with terms like "disabled," "unable," and "complex" significantly more often than women's, who were often framed as more independent despite similar needs, an alarming gender bias trend." (Source: crescendo.ai)
- What is the ideal "unbiased" scenario? Is an "unbiased" scenario possible?

Bias in AI: Summary

- AI training data reflects the injustices and biases of the society that produced it.
- These biases can be amplified when they are input as training data into an AI, because they seem to be the "right" answers (Dwivedi et al, 2023).

Bias in AI: Example

Example: "Provide a short literature review (10–12 citations) on how social support buffers stress in social psychology." AI-Generated Answer:

1. Cohen & Wills (1985) — "Stress-buffering hypothesis."
2. Taylor et al. (2004) — Tend-and-befriend model.
3. House (1981) — Types of social support.
4. Lazarus & Folkman (1984) — Transactional model of stress.
5. Thoits (2011) — Mechanisms of support.
6. Uchino (2004) — Physiological pathways.
7. Cohen & Hoberman (1983) — Perceived support scale.
8. Taylor et al. (2007) — Cultural differences in support seeking.
9. Eisenberger et al. (2011) — Neural correlates.
10. Helgeson & Tomich (2005) — Support and health outcomes.

Question: what are the problems?

(ChatGPT 4o, OpenAI, Accessed June 26th, 2025)

Feel free to ask questions at any point during the presentation!

Bias in AI: Types (1/2)

Bias Type	How It Shows Up in the Example	Why It Happens
Western bias	9 of 10 citations are from U.S.–based authors; only one touches on culture.	Training data over-represents English-language, high-impact Western journals.
Prestige bias	Classic, highly cited papers dominate; recent community-based or non-English studies are missing. "Rich get richer."	The model "learns" that frequently quoted articles are more "salient."

Feel free to ask questions at any point during the presentation!

Bias in AI: Types (2/2)

Bias Type	How It Shows Up in the Example	Why It Happens
Methodological bias	Focus on self-report and lab work; qualitative or mixed-methods field studies are absent.	Quantitative experimental papers appear more often online than small-sample or ethnographic work.
Gender / editor influence	Majority of cited first authors are male despite large contributions by female scholars in caregiving research.	Historical citation patterns in the corpus perpetuate disparities.

Feel free to ask questions at any point during the presentation!

Bias in Results: Claude 3.7 Sonnet

Prompt: *Please write two sentences about the greatest discoveries in psychology and who those discoveries were made by*

Response: Two influential discoveries in psychology include Ivan Pavlov's classical conditioning, which demonstrated how reflexive behaviors could be triggered by previously neutral stimuli, and Albert Bandura's social learning theory, which revealed that humans learn not only through direct reinforcement but also by observing and imitating others' behaviors and their consequences. (Claude 3.7 Sonnet, Anthropic, Accessed April 10th, 2025) What are the things that could go wrong here?

Feel free to ask questions at any point during the presentation!

Countering Bias

Countering Bias: Women Psychologists

Prompt: *Please write two sentences about the greatest women psychologists in the world*

Response: Some of the greatest women psychologists include Mary Whiton Calkins, who became the first female president of the American Psychological Association, and Margaret Floy Washburn, the first woman to earn a Ph.D. in psychology and a pioneer in comparative psychology. Other influential figures include Karen Horney, who challenged Freud's theories with her work on psychoanalytic feminism, and Elizabeth Loftus, renowned for her groundbreaking research on the malleability of human memory. (ChatGPT 4o, OpenAI, Accessed April 1st, 2025)

Northeastern University
NULab for Digital Humanities and Computational Social Science

Feel free to ask questions at any point during the presentation!

Countering Bias: Global South Psychologists

Prompt: *Please write two sentences about the greatest psychologists from the Global South*

Response: Among the greatest psychologists from the Global South is Ignacio Martín-Baró of El Salvador, who founded liberation psychology to address the mental health impacts of poverty and oppression in Latin America. Another key figure is India's Girindrasekhar Bose, who established psychoanalysis in South Asia and corresponded with Freud, offering culturally rooted insights into the human mind. (ChatGPT 4o, OpenAI, Accessed April 1st, 2025)

Countering Bias: Discussion

- What groups of psychologists are still excluded from these summaries?
- What other biases may they contain?
- What are biases that we cannot counter by changing prompts?

Countering Bias: Prompts and Feedback

- Bias can be partly countered through careful prompt design and feedback (Dwivedi et al, 2023). However, these methods do not remove bias intrinsic in the model (Shin et al, 2024)
- Practices for countering bias
  - Identify gaps or inconsistencies in generative AI responses.
  - Use additional inquiry and prompt revision to help fill in gaps.
  - Double check responses with other sources.

Feel free to ask questions at any point during the presentation!

How to use AI responsibly EVERY time

- "**Evaluate** the initial output to see if it meets the intended purpose and your needs."
- "**Verify** facts, figures, quotes, and data using reliable sources to ensure there are no hallucinations [or confabulations] or bias."
- "**Engage** in every conversation with the GenAI chatbot, providing critical feedback and oversight to improve the AI's output."
- "**Revise** the results to reflect your unique needs, style, and/or tone. AI output is a great starting point, but shouldn't be a final product."
- "**You** are ultimately responsible for everything you create with AI. Always be **transparent** about if and how you used AI."

Can you tell be about the psychology of cats?

Initial prompt

Absolutely! The psychology of cats is fascinating because it combines their evolutionary history as solitary hunters with their ability to form social bonds with humans and other animals. Here are some key aspects:

1. Evolutionary roots:
Cats evolved as solitary hunters, which shapes much of their behavior. Unlike dogs (descended from pack animals), cats are more independent, territorial, and selective about social interactions.

Response

2. Social behavior:
Although often labeled "aloof," domestic cats can form deep attachments. They recognize their humans' voices, show preference for familiar people, and may follow routines around food and play. Their affection often comes in subtle ways: slow blinking, rubbing against you, or sitting nearby.

Enter subsequent prompts as text or speech

3. Communication:
Cats communicate with body language, scent marking, and vocalizations. Interestingly,

SM Can you provide a list of common biases in AI generated literature reviews?

Here are common biases that can occur in AI-generated literature reviews:

Selection and Search Biases

- **Training data bias** - AI models reflect the biases present in their training datasets, which may overrepresent certain types of research, languages, or publication venues

- **Recency bias** - Overemphasis on recent publications while undervaluing foundational or older work that remains relevant

- **Publication bias** - Tendency to focus on published studies while missing important unpublished research, gray literature, or negative results

- **Language bias** - Disproportionate emphasis on English-language publications, missing valuable research in other languages

Analytical and Interpretive Biases

- **Confirmation bias** - Selectively highlighting studies that support predetermined conclusions while downplaying contradictory evidence

- **Cherry-picking** - Focusing on specific findings from studies while ignoring conflicting results within the same research

AI Plagiarism Checkers

Feel free to ask questions at any point during the presentation!

Plagiarism Checkers: Summary

- Some companies sell tools that [claim to identify](#) whether text is AI-generated or human-generated.

- They do this by calculating [how statistically predictable each word in the text is](#).

- AI-checkers can be **wrong**: If a text consistently uses predictable words it is more likely to be [labeled as AI generated](#).

Feel free to ask questions at any point during the presentation!

Plagiarism Checkers: Biases

- These tools have the potential for false positives (identifying human texts as AI).
- False positives are especially likely for [texts by writers for whom English is not their first language] or for writers who have [autism, ADHD, dyslexia, or related neurodivergence].
- To make things worse, writers can often [*reduce* their "AI score"] by using an AI to reword their essays.
