
Handout for coding in Google Collaboratory

[Click to schedule a meeting with the DITI Team](#)

- How to work with Google Colab?
- What is Google Colab?

Google Collaboratory is a free online tool for coding and data work, enabling you to write and run Python and R code without any local installations required. You need to have a Google Account, if you have a Gmail account that is enough.

- Log in to your Gmail Account.
- Navigate to New, scroll down to see until you see More, in the next new Select Connect more apps option. In the window that will open Google Workplace Marketplace.
- Navigate to the Search menu Type Collaboratory, which will bring up an orange yellow Collaboratory, select that and then hit Install button on the right side of the window.

You can now use [Google Colab](#).

On the Google Colab you will see The Example tab will show you some instructions and templates of how to use Google Colab

To start a New Notebook, Select the blue New notebook button.

The first thing you will see is a cell, which is a building block of Google Colab notebooks

There are two types of cells: Code and Text.

- The Code cell is designed to contain an executable code which can be Run using the button on the left side (it looks like a Play button). The output of the code run will be displayed below the Code cell once the Run action is completed.
- The Text cell can include text, images, and more. It supports Markdown/Markup language. The right-side window will show how the text will appear.

Digital Integration Teaching Initiative

To add either a Code or a Text cell, you can select the Plus button at the Top Left side of the screen.
