
Creating Surveys with Qualtrics

[Click to schedule a meeting with the DITI Team](#)

What is Qualtrics?

Qualtrics is a digital tool designed for collecting and analyzing survey data. Users can utilize it to design and deploy customer experience surveys, longitudinal surveys, and structured interviews. The built-in analysis and visualization features of Qualtrics allows its users to run basic reports and create visualizations making the process of engaging the data accessible within minutes.

Noteworthy Features

- Drag-and-Drop Interface
- Secure Login Authentication
- Results Visualization
- Mail-Distribution Tools
- Statistical Analysis
- Data Export Tools
- Survey Template Library
- Survey Accessibility

Components of an effective survey:

- Identify the main purpose of the survey.
 - The survey should have a clear and coherent purpose.
- Make every question count.
 - Consider the value of each question and ensure that it directly supports your research objective.
- Keep the survey simple and short.
 - Remember that the most common problem with surveys is a low engagement rate. Simple and straightforward language will keep your respondents focused and reduce the rate of drop-offs.
- One question at a time.
 - Focus on one idea in each question to avoid a double-barreled question that will cause confusion and inaccuracies in your results.

Digital Integration Teaching Initiative

- Avoid vaguely worded questions.
 - Vaguely or poorly worded questions will yield vague and hard to analyze answers.
 - Be as specific as possible and use only clear and precise language.
- Avoid judgmental language or leading questions
 - Ensure that the words and phrases you use do not introduce bias into your survey or push the respondents towards a particular answer.
- Limit complex response formats such as matrices or grids.
 - Multiple-choice and scale questions are used most since they are easy to engage with.
 - Matrice questions tend to be hard to read and interact with for users on mobile devices. While these questions are less problematic on computer screens, consider rephrasing your questions around mobile friendliness.
- Consider accessibility
 - Keep in mind users with a variety of needs such as screen-readers and sufficient color contrast, to ensure all respondents can participate.
- Add incentives.
 - If possible, incentives, such as gift cards, will increase the number of responses.
- Test the survey.
 - Before running the survey, pilot test it with a small group of colleagues or peers and ask for their feedback. It is especially helpful to share it with someone who has never seen this survey before or is not familiar with your project.
 - Test your survey on different types of devices and screen sizes, including computers, iPads/tablets, and most importantly mobile devices.
